Project management

13/2/2020

The first major decision we all had to make was what project we wanted to make. After much group discussion we decided that car detection was the best choice and something we were all interested in.

Next, we had to decide which missions everyone wanted to do. I picked up project management and additional data as no one else spoke up about it. Mark chose project ideation and Baseline implementation. Kenneth took project testing and solution review. With Pablo not being in contact we sent a message and waited on his response.

19/2/2020

We have a new member, Owen. Owen was available and chose his missions as GUI and API

3/3/2020

During meeting we divided tasks between people those tasks were different vehicles we would be detecting. Mark will be detecting cars. I (Jay) will be detecting trucks. Kenneth will be detecting bikes. Pablo will be detecting buses and lastly Owen will be detecting motorbikes.
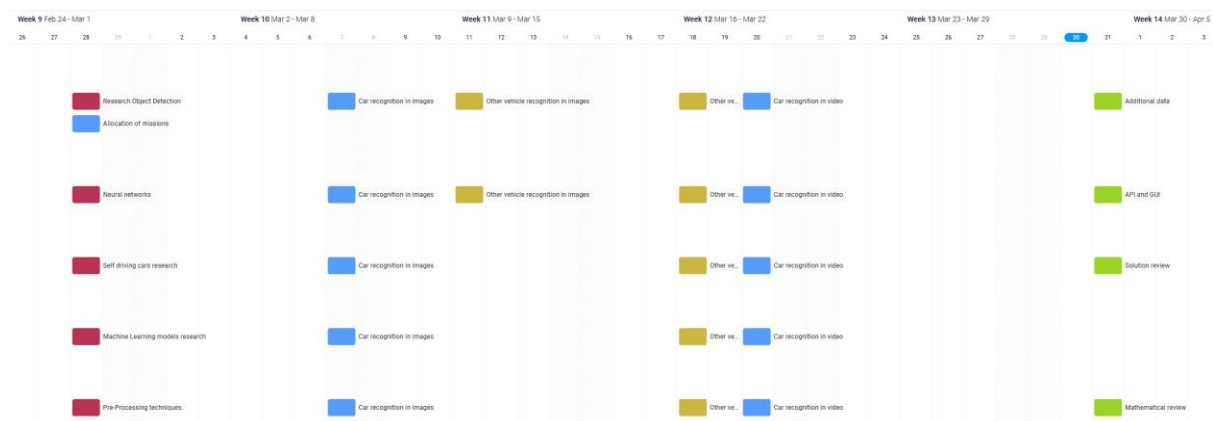

Schedule:

24/2/2020

For making this schedule I will be using Mondays to keep track of events.

For the initial draft I decided that everyone should research a topic that would help us create this system. For example methods of how bounding boxes are found, and other algorithms involved in machine vision.

After this there will be a steady work flow of taking a week to develop the algorithm to work via detection in images. Then we will move onto video which will be allowed 2 weeks of development, before starting on the side missions. Shortly after these are created we will change the algorithm to support multiple different types of vehicle, not just cars.

(At the time of making this I didn't know how to make it look like a gantt chart.)

30/3/2020

Due to multiple unforeseen issues which have destabilised this workflow I have had to make several adjustments to compensate.

The first issue has been that it has taken several weeks for the initial algorithm to be developed, after now being moved up to urgent priority it has now been created on the 25/3/2020. Missing most deadlines, therefore I have been forced to push back all deadlines to compensate for this.

The second issue has been that COVID-19 has made real time tracking of cars now impossible due to the lockdown, I will therefore be removing this from the scheduled list of things to do.

Other smaller changes I have made have been pushing testing deadlines to the end of the assignment deadline. As I believed it to be unfair to give Kenneth only 2 days to test this algorithm.

As well as this I have moved the other vehicle recognition to be 2 separate weeks after video recognition has been implemented.
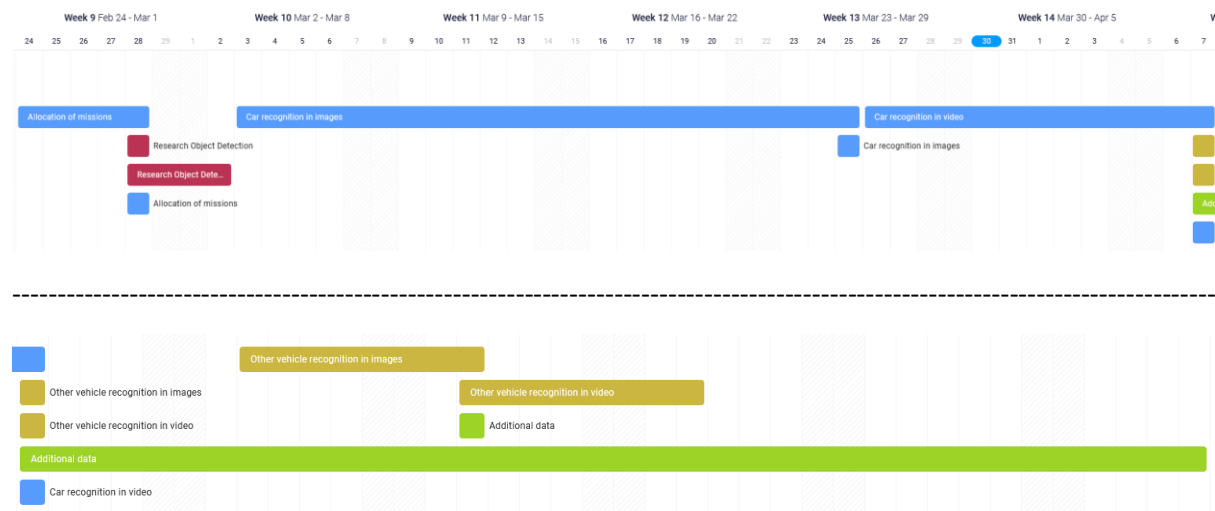

And lastly I have decided to remove different vehicles from the models detection. This is partly due to memory issues as well as the fact that our model currently struggles to detect it's main objective.

Main missions

	Owner	Status	Due date	Priority	Timeline
Allocation of missions	JD	Done	Feb 28	Urgent	Feb 24 - 28
Car recognition in images	JD +4	Done	Mar 25	Urgent	Mar 2 - 25
Car recognition in video	JD +4	Working on it	Apr 7	Medium	Mar 25 - Apr 7
Testing Detection in images		Working on it	May 14		Mar 25 - May 14
Testing Detection in Video		Working on it	May 14		Apr 7 - May 14
+ Add					
					Feb 24 - May 14

Side missions

	Owner	Status	Due date	Priority	Timeline
API and GUI	OL	Working on it	Apr 21	Medium	Apr 7 - May 8
Additional data	JD	Working on it	Apr 21	Medium	Apr 7 - May 14
Mathematical review		Working on it	Apr 21	Medium	Apr 7 - May 14
Solution review		Working on it	Apr 21	Medium	Apr 7 - May 14
+ Add					
					Apr 7 - May 14

Research

	Owner	Status	Due date	Priority	Timeline
Neural networks	OL	Done	Feb 28	High	Feb 28 - Mar 2
Research Object Detection	JD	Done	Feb 28	High	Feb 28 - Mar 2
Self driving cars research		Done	Feb 28	High	Feb 28 - Mar 2
Machine Learning models research		Done	Feb 28	High	Feb 28 - Mar 2
Pre-Processing techniques.		Done	Feb 28	High	Feb 28 - Mar 2
+ Add					
					Feb 28 - Mar 2

Things we can do if we have the time

	Owner	Status	Due date	Priority	Timeline
Other vehicle recognition in images	JD OL	Working on it	Apr 7	High	Apr 14 - 21
Other vehicle recognition in video	JD +4	Working on it	Apr 7	Medium	Apr 21 - 28
+ Add					
					Apr 14 - 28

28/4/2020

As of today I have no idea how close anyone is to completing their assigned tasks, no one has attended meetings in 3 weeks apart from Kenneth who simply said he is getting on fine with his

work. In the next week I will be chasing people for their work so that I can eventually upload it before the hand in date. I have provided folders for those who are able to contribute to upload their work should they finish it and not with to send me it. With the exception of Kenneth who has been struggling getting connected to the github repository due to his email not being accepted for some reason.

PS: There were some issues when attempting to scale other vehicle recognition in videos and images as well as additional data.

<u>Anomalous events</u>

19/2/2020

We have a 5th member in our team, Owen. With Pablo having not been around to choose his missions it is now between both Pablo and Owen to see who gets what first. They have the choice of Solution design, Mathematical review, API and the GUI.

13/3/2020

University is starting to close its doors due to the coronavirus; this was not anticipated however we always have discord for keeping in contact and GitHub for sharing code with each other. Therefore it shouldn't affect us too much.

26/3/2020

I have been informed that some of my group members have moved back home due to COVID-19. And thus have limited access to hardware. I referred back to the risk analysis sheet I have created and thus referred them back to google colab, I also offered that I would compute anything such as models when needed as I will not be staying and my hardware is able to do this within a reasonable time frame.
